Instalación y administración de servidores de transferencia de archivos VirtualBack VirtualFront

Instalación y administración de servidores de transferencia de archivos

VirtualBack

Instalamos mysql en el servidor

```
master@daw-118:~$ sudo apt-get install mysql-server mysql-client
Reading package lists... Done
Building dependency tree
Reading state information... Done
The following additional packages will be installed:
    libaiol libcgi-fast-perl libcgi-pm-perl libencode-locale-perl
    libevent-core-2.1-6 libfcgi-perl libhtml-parser-perl libhtml-tagset-perl
    libhtml-template-perl libhttp-date-perl libhttp-message-perl libio-html-perl
    liblwp-mediatypes-perl libtimedate-perl liburi-perl mysql-client-5.7
    mysql-client-core-5.7 mysql-common mysql-server-5.7 mysql-server-core-5.7
```

Y lo configuramos

```
mysql> show databases;
 Database
 information_schema |
 mysql
 performance_schema |
 sys
 test_virtual
 rows in set (0.00 sec)
mysql> create user 'user'@'localhost' identified by 'user';
Query OK, 0 rows affected (0.00 sec)
mysql> select user from mysql.user;
 user
 debian-sys-maint |
 mysql.session
 mysql.sys
 root
 user
rows in set (0.00 sec)
mysql> grant all privileges on test virtual.* to 'user'@'localhost' with grant o
ption:
Query OK, 0 rows affected (0.01 sec)
```

Creando una base de datos

Instalo Maven y el jdk

```
master@daw-118:~$ sudo apt-get install maven
Reading package lists... Done
Building dependency tree
Reading state information... Done
The following additional packages will be installed:
 ca-certificates-java default-jre-headless java-common libaopalliance-java libapache-pom
 libcommons-cli-java libcommons-io-java libcommons-lang3-java libcommons-parent-java lib
  libhawtjni-runtime-java libjansi-java libjansi-native-java libjpeg-turbo8 libjpeg8 lib
 libplexus-cipher-java libplexus-classworlds-java libplexus-component-annotations-java
 libwagon-file-java libwagon-http-shaded-java libwagon-provider-api-java openjdk-ll-jre-
Suggested packages:

Suggested packages:
```

Activo el vsftpd, cambiando la configuración del vaftpd.conf ya que lo habia alterado en la prueba anterior, u reiniciando el vsftpd

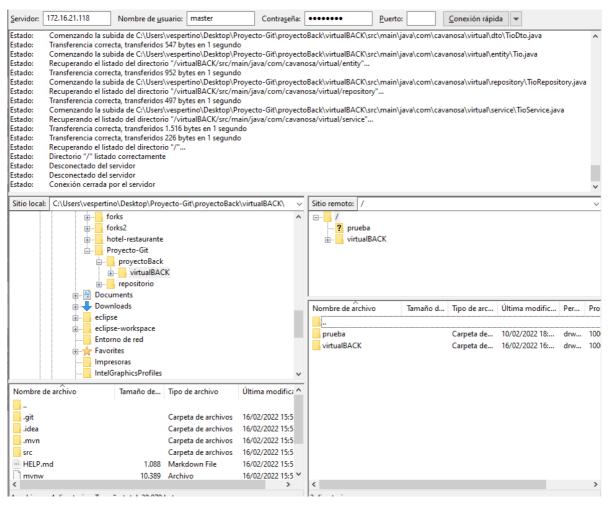

```
master@daw-l18:-$ sudo nano /etc/vsftpd.conf
master@daw-l18:-$ sudo systemctl restart vsftpd.service
master@daw-l18:-$ sudo systemctl status vsftpd
Failed to dump process list, ignoring: Input/output error

```

Descargo un proyecto de github, haciendo un bash en una carpeta y clonando el repositorio en el mismo

```
vespertino@DESKTOP-2MO8M8P MINGW64 ~/Desktop/Proyecto-Git/proyectoBack
$ git clone https://github.com/cavanosa/virtualBACK.git
Cloning into 'virtualBACK'...

```

Tras esto lo subo al servidor con Filezilla

Ejecuto mvn clean para elminar el target

Ejecuto mvn install para generar el .jar

Vemos que se ha creado el tarjet, por lo que procedo a ejecutar el .jar, abriendo el puerto 8080

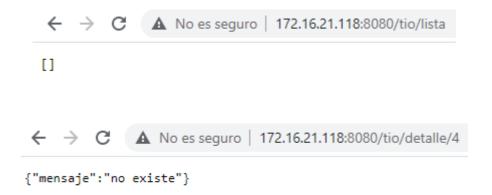

```
master@daw-118:~/virtualBACK$ sudo ufw allow 8080
Rule added
Rule added (v6)
master@daw-118:~/virtualBACK$ java -jar target/virtual.jar
```

En el anfitrión accedemos a la ip, miramos la lista de tíos que hay, y en concreto el que tiene id 4 (que no existe)

Whitelabel Error Page

This application has no explicit mapping for /error, so you are seeing this as a fallback.

Wed Feb 16 15:33:56 UTC 2022
There was an unexpected error (type=Not Found, status=404).
No message available

Ahora convertimos en ejecutable el .jar, de modo que al arrancar el servidor virtual todos los programas en los que corre la aplicación se inicie al arrancar el sistema

master@daw-118:~/virtualBACK\$ sudo nano /etc/systemd/system/spring.service

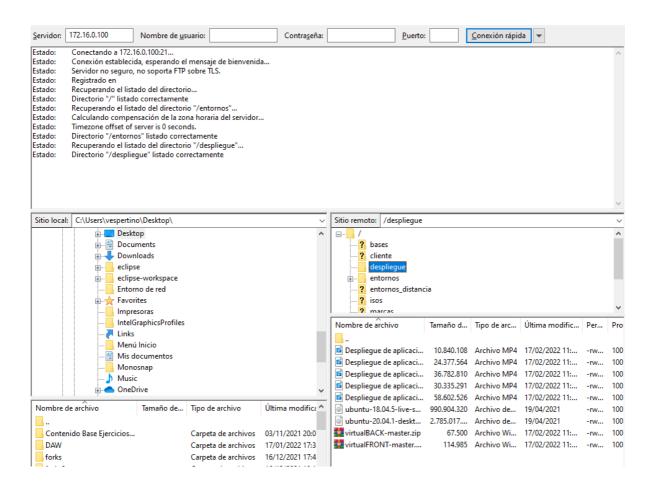

```
[Unit]
Description=my spring boot app

[Service]
Restart=always
ExecStart=/home/master/virtualBACK/target/virtual.jar
SuccesExitStatus=143

[Install]
WantedBy=multi-user.target
```

master@daw-l18:~/virtualBACK/target\$ sudo systemctl enable spring.service
Created symlink /etc/systemd/system/multi-user.target.wants/spring.service -> /e
tc/systemd/system/spring.service.
master@daw-l18:~/virtualBACK/target\$ sudo systemctl is-enabled spring.service
enabled

Descargo la carpeta de back en mi escritorio, mediante un ftp al servidor 172.16.0.100

VirtualFront

Abro los puertos 80 y 4200 para poder acceder a la aplicación web desde el navegador

```
master@daw-118:~$ sudo ufw allow 80
Rule added
Rule added (v6)
master@daw-118:~$ sudo ufw allow 4200
Rule added
Rule added (v6)
```

Tuve algunos problemas con los permisos, a causa de la tarea del despliegue de una aplicación en VPS, por lo que no podía acceder a los ficheros del /var/www/html para subir la aplicación

```
master@daw-118:~$ sudo nano /etc/vsftpd.conf
master@daw-118:~$ sudo systemctl stop vsftpd
```

Para subir los diferentes ficheros, tuve que darle permiso en la carpeta.

```
master@daw-118:~$ sudo ufw disable
Firewall stopped and disabled on system startup
master@daw-118:~$ sudo chmod -R 755 /var/www/html/
```

Mediante la ejecución de la instrucción code en GitBash, me abre el VisualStudio donde puedo editar y ejecutar comandos para desplegar la aplicación. Para ello ejecuto el comando npm run ng serve -o

```
PS C:\Users\vespertino\Desktop\Proyecto-Git\proyectoFront\virtualFRONT> npm run ng serve -0

> virtual-front@0.0.0 ng C:\Users\vespertino\Desktop\Proyecto-Git\proyectoFront\virtualFRONT

> ng "serve"

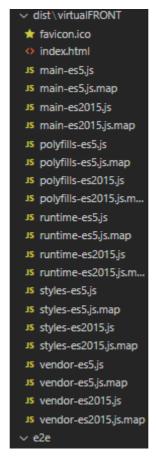

Browserslist: caniuse-lite is outdated. Please run next command `npm update`
(node:4996) Warning: Accessing non-existent property 'cat' of module exports inside circular dependency
(Use `node --trace-warnings ...` to show where the warning was created)
(node:4996) Warning: Accessing non-existent property 'cd' of module exports inside circular dependency

(node:4996) Warning: Accessing non-existent property 'cn' of module exports inside circular dependency
```

Tras crear el archivo necesario para el despliegue lo despliego con npm run ng build --prod, que me crea la carpeta dist. El comando npm run es un comando que me resulto necesario para ejecutar las instrucciones ng

```
PS C:\Users\vespertino\Desktop\Proyecto-Git\proyectoFront\virtualFRONT> npm run ng build --prod

> virtual-front@0.0.0 ng C:\Users\vespertino\Desktop\Proyecto-Git\proyectoFront\virtualFRONT
> ng "build"

```

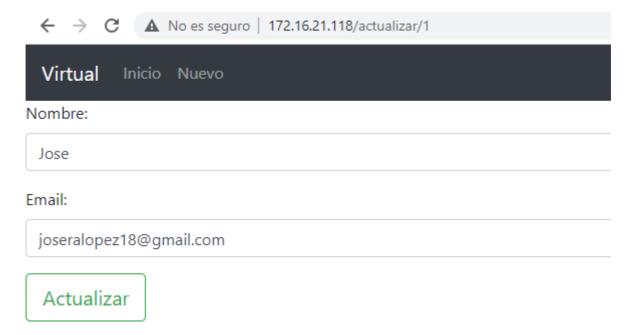

Comprobamos que al acceder al servidor mediante Google Chrome, podemos acceder a la aplicación de forma correcta, donde tenemos un usuario con mi nombre

De igual modo, al acceder a la pestaña de "Ver", sección destacada del usuario, podemos comprobar los detalles del usuario.

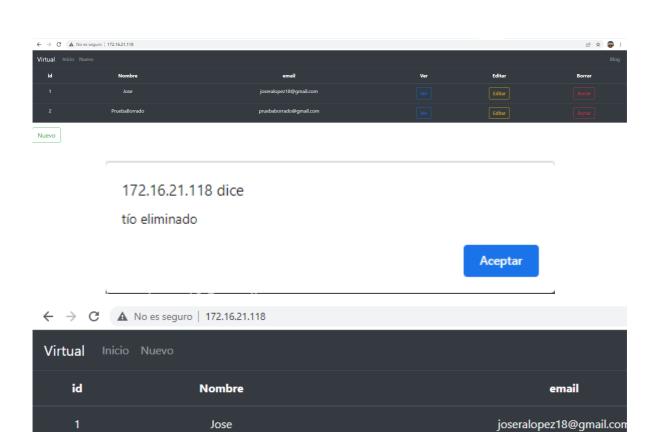

Así como podemos editar tanto el nombre como el correo

Por último, creamos un nuevo usuario, que será el que utilicemos para borrar, y como vemos en las siguientes capturas, nos salen los datos debajo del anterior "tío". Al eliminarlo, nos salta una alerta que nos dice que ha sido eliminado, por lo que ya no aparece mas en la tabla

Nuevo
